# ENVIRONMENTAL Data Management & Reporting System

## Pre-Regulation: Current Times

---

Now, a *new* factor is added to this formula

▶ **Market**

▶ **Production Capacity**

▶ **Resources** (raw materials, plant & human resources)

▶ **Ability to Deliver**

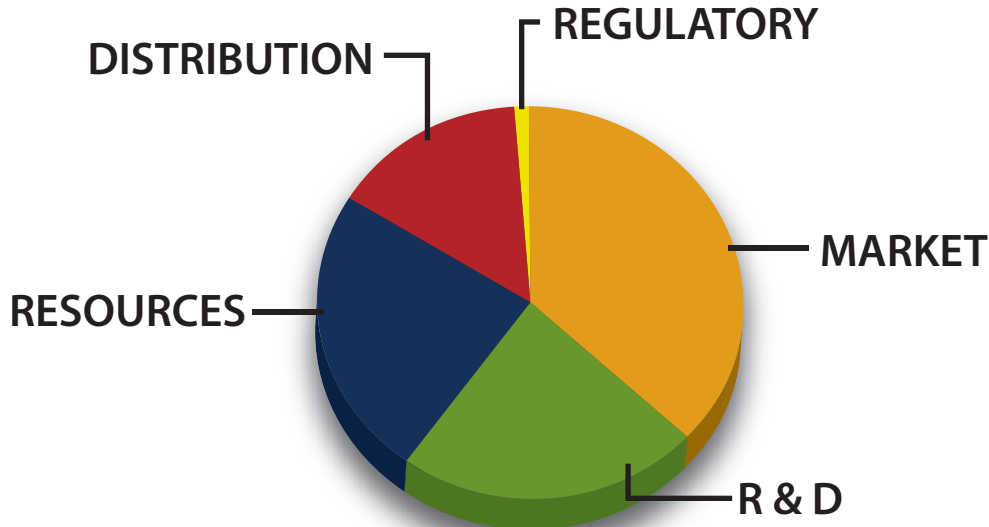

▶ **Regulatory Limits**

If all other areas would otherwise indicate an increase in production, you may still be

**RESTRICTED** 

by permitting limits.

A company spends most of its dollars in managing **production limiting factors**.

*Often, a significant less priority is applied to Regulatory Limiting factors.*

**Managing your  
environmental limits  
is *still* possible.**

Environmental management is a complex task, usually enough just to achieve regulatory compliance.

Going beyond to manage regulatory limits to serve production requirements requires accurate data and your ability to use it.

To achieve this cost effectively requires a system in which the formulas and rules are built once and maintained henceforth.

The system should then accommodate rapid turnaround from raw data input to report without intervention.

Companies are faced with complex data management and reporting requirements of the EPA.

These complexities are apparent in several ways:

## Regulatory Diversity

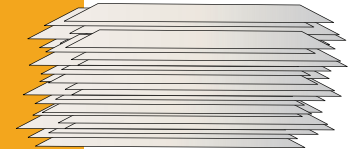

Multiple regulatory standards apply to a single manufacturing process.

This results in multiple data entry in order to feed all environmental reporting inputs.

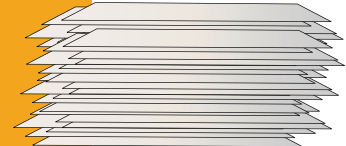

### FOR EXAMPLE:

A single Paint Booth operation has reporting requirements for:

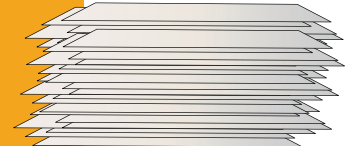

Voc Emissions

Particulate Emissions

HAPs Emissions

Hazardous Waste Collection, Manifest & Disposal

Form R

# Environmental

KHA Environmental will assure your environmental reporting and data management compliance with an **easy to use system** that is designed to provide you with an invaluable management tool for

**REPORTING,**

**ANALYZING,**

**& MODELING**

your environmental data.
